

How to Create Your Signlite

Signlite background

Contents

- 1 Signlite EL 8.5"x11", five lite background template
- 1 Sequencing inverter
- 1 Power supply
- Optional acrylic counter stand

Create your sign

- Download background template PDF from <http://signlites.com/wp-content/uploads/2014/09/8.5x11-5-segment-1.pdf>
- Open the pdf in your image editing software and create your sign graphic using the background as a reference for the five illuminated Signlite areas.
- When you finish the sign art, create a black and white mask for the illuminated areas.

Example of user created transparent mask

Print your sign

- Print the color graphic overlay on a translucent material suitable for backlighting.
- Print the b/w mask on a clear transparent material using maximum black density to create opaque areas. It may require two or three duplicate prints sandwiched together to achieve mask opacity.

Example of user created translucent graphic overlay

Assemble your sign

- Create a stack of the Signlite EL background, mask and graphic overlay and slide them together into the acrylic stand or other clear frame. Be careful not to kink the ribbon cable as you assemble the parts.
- Connect the ribbon cable from the EL lite to the inverter. Connect the power supply to the inverter, plug in the power supply, and then turn on inverter.

Marvel at your sign

- Your Signlite will begin to cycle through the light pattern, illuminating the five lit segments of your design.
